

APTER POWER PRODUCT GUIDE

LZ01

H&B Contronic Module

The ABB H&B Contronic LZ01 is a legacy control-system module identified by the LZ01 hardware code. It is retained as a model-specific unit for the installed Contronic assembly.

Manufacturer	ABB
Model	LZ01
Product type	H&B Contronic Module
Product family	H&B Contronic
Country	Sweden
HS code	8537101190
Shipping origin	Xiamen, Fujian, China

APTER POWER SALES TEAM

INDUSTRIAL AUTOMATION PRODUCT SUPPORT

Three interface paths, one controlled configuration.

SCAN FOR PRODUCT & QUOTE

1. Product overview and identity

- Maintains the documented LZ 01 position in the installed cabinet
- Preserves the original controller-to-module assignment
- Supports model-specific service work without changing the slot identity
- Keeps wiring and configuration aligned with the plant drawing set

Model configuration

Complete model	LZ01
Product type	H&B Contronic Module
System family	H&B Contronic

2. Technical specifications

Model-controlled field verification

Use the complete model identity, installed carrier position, wiring schedule and controller configuration as the controlling technical records.

3. Functions, applications and components

LZ01 cabinet-position retention

Maintains the documented LZ 01 position in the installed cabinet

LZ01 control-loop service

Preserves the original controller-to-module assignment

LZ01 shutdown maintenance

Supports model-specific service work without changing the slot identity

LZ01 engineered replacement planning

Keeps wiring and configuration aligned with the plant drawing set

Associated system components

- H&B Contronic carrier or rack
- installed terminal wiring
- controller configuration
- plant loop drawings

4. Engineering FAQ and source record

How should LZ01 be identified before cabinet work?

Read the LZ 01 front label, board revision and installed slot, then record all three in the job package.

What compatibility check is required for LZ01?

Match LZ01 to the original carrier position, connector keying and controller configuration.

How should wiring be handled when removing LZ01?

Label every conductor and terminal position before disturbing the LZ01 circuit.

What configuration should be retained for LZ01?

Retain the slot assignment, loop references and controller database entry associated with LZ01.
