TC520 3BSE001449R1

Complete Product Information | system use and selection

The TC520 participates in the status hardware of an Advant Master installation. The exact article is listed in both AC 450 and AC 460 parts references, while the rack wiring and configured status paths remain project-specific.

Application context

Advant Master AC 450 service Review TC520 as a listed spare for an AC 450 system with matching installed hardware.	**Status collection integration** Confirm the status path and interface assignments from project drawings and controller configuration.

Selection considerations

The AC 450 and AC 460 references support the product identity. A replacement decision still needs the actual rack, status channel and revision record from the installation.

Engineering questions

If the controller continues to report a missing or inconsistent status after replacement, trace the configured status source and receiving logic against the as-built drawing.

Source boundary

The ABB document confirms identity and AC 450 / AC 460 parts-list placement; it does not publish a TC520-specific voltage, channel count, interface rating or pinout.
